Abstracts

The global Multi Rackmount GPU Server market size is expected to reach \$ 29734 million by 2032, rising at a market growth of 18.1% CAGR during the forecast period (2026-2032).

A Multi Rackmount GPU Server is a specialized compute platform designed to house and interconnect multiple Graphics Processing Units within a single system enclosure. Its core function is to aggregate the parallel processing power of individual GPUs, creating a unified resource capable of tackling computational problems that are too large, complex, or time-sensitive for a single accelerator. This architecture fundamentally addresses the core requirement of dividing massive, parallelizable workloads—such as deep learning model training, scientific simulations, or large-scale rendering—into smaller tasks that can be processed concurrently across all available GPUs. The resulting capability enables a dramatic reduction in computation time, allows for the processing of larger datasets or more complex models that exceed the memory capacity of a single GPU, and provides a scalable foundation where performance can be increased by adding more accelerators, albeit with careful consideration for inter-GPU communication bandwidth, thermal output, and power delivery. In 2025, global Multi Rackmount GPU Server production reached approximately 723 k units with an average global market price of around k US\$12.4 per unit with a gross margin of approximately 29%.

This report studies the global Multi Rackmount GPU Server production, demand, key manufacturers, and key regions.
