Abstracts

The global Multi-Storey Car Parks market size is expected to reach \$ 2559 million by 2032, rising at a market growth of 2.7% CAGR during the forecast period (2026-2032). Multi-storey car parks, also called automated (car) parking system (APS), is a mechanical system designed to minimize the area and/or volume required for parking cars. Like a multi-story parking garage, an APS provides parking for cars on multiple levels stacked vertically to maximize the number of parking spaces while minimizing land usage. The APS, however, utilizes a mechanical system to transport cars to and from parking spaces (rather than the driver) in order to eliminate much of the space wasted in a multi-story parking garage. While a multi-story parking garage is similar to multiple parking lots stacked vertically, an APS is more similar to an automated storage and retrieval system for cars.

The upstream supply chain for multi-storey car parks typically comprises structural materials and components, MEP and low-voltage systems, plus design/engineering and project management. Downstream demand comes from municipalities/transport hubs, commercial real estate and industrial parks, and institutional owners (hospitals/universities).

In 2025, global multi-storey car parks production reached approximately 1 million units, with an average global market price is \$2,000 per unit.

Multi-storey car parks are structures designed to provide multiple levels of parking space, maximizing the use of land in urban areas where space is limited. These parking facilities are commonly found in densely populated cities, commercial centers, airports, and public venues. The design and construction of multi-storey car parks aim to accommodate a large number of vehicles in a relatively small footprint, addressing the growing demand for parking spaces in high-traffic areas.

One of the primary advantages of multi-storey car parks is their ability to save space and improve parking efficiency. By building vertically, these structures can hold

hundreds or even thousands of cars, relieving congestion on streets and reducing the need for expansive surface parking lots. Many modern multi-storey car parks also incorporate smart parking systems, which help drivers locate available spots quickly and optimize traffic flow within the facility.

Environmental considerations have also influenced the development of multi-storey car parks. Green design elements such as solar panels, electric vehicle charging stations, and energy-efficient lighting are becoming more common. In some cases, these car parks are integrated with mixed-use developments, combining parking with retail or office spaces to further enhance land use efficiency.

Overall, multi-storey car parks are an essential infrastructure solution for modern cities, providing convenient parking options while helping to manage urban land resources more effectively. As urbanization continues, the demand for such facilities is likely to grow, with innovations in design, technology, and sustainability playing a significant role in their future development.
