According to our (Global Info Research) latest study, the global Multibeam Imaging Sonar market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Multibeam imaging sonar is a type of sonar technology used for underwater mapping and imaging. It uses multiple sonar beams to create a detailed and high-resolution image of the underwater environment. Unlike traditional single-beam sonar systems that emit a single sound wave and measure the time it takes for the wave to bounce back, multibeam sonar systems emit multiple sound waves simultaneously at different angles. The system then measures the time it takes for each of these waves to return to the sensor. By analyzing the data from multiple beams, the system can create a detailed image of the seafloor or other underwater objects.
