Abstracts

The global Multibeam Sonar System market size is expected to reach \$ 294 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

Multibeam sonar system is a common offshore surveying tool that uses multiple sound signals to detect the seafloor. Because of its multiple beams it is able to map a swath of the seabed under the ship, in contrast to a single beam sonar which only maps a point below the ship. With the capability to cover 100 per cent of the seafloor, multibeam sonars are becoming the industry standard for hydrographic and geological applications.

Multibeam sonar system is used to map the seabed. Like other sonar systems, multibeam systems emit acoustic waves in a fan shape beneath the multibeam sonar's transceiver (a combined radio transmitter and receiver). The time it takes for sound waves to reflect off the seabed and return to the receiver is used to calculate the water depth. Multibeam sonar systems use beamforming to extract directional information from the returning soundwaves, producing a swath of depth readings from a single ping. Because of its multibeam configuration, the sonar can map a swath of the seafloor rather than just mapping a single point.

In 2025, global Multibeam sonar system sales volume reached approximately 4100 units, with an average global market price of around k US\$ 50 per unit.

1) Expanding offshore energy and subsea infrastructure development

The rapid expansion of offshore energy projects—especially offshore wind farms, oil & gas exploration, and subsea cable installations—is a primary driver of the multibeam sonar market. Multibeam sonar systems are essential for high-resolution seabed

mapping, pipeline route surveys, and structural inspections before and after installation. As countries accelerate renewable energy deployment and intercontinental power/data connectivity (subsea cables), demand for precise bathymetric data has increased significantly. In addition, aging offshore oil & gas assets require regular inspection and maintenance surveys, further sustaining demand. This combination of new-build projects and lifecycle monitoring ensures steady growth in multibeam sonar adoption across the offshore sector.

2) Increasing demand for hydrographic surveying and marine mapping

Governments and research institutions worldwide are investing heavily in hydrographic surveying to support maritime safety, coastal management, and environmental monitoring. Multibeam sonar provides accurate, wide-swath seabed mapping, making it indispensable for updating nautical charts, detecting underwater hazards, and managing ports and waterways. Programs such as seabed mapping initiatives and oceanographic research projects are expanding globally, particularly in regions with limited existing data coverage. Additionally, climate change impacts—such as coastal erosion and sea-level rise—are driving the need for continuous seabed and shoreline monitoring, further boosting demand for advanced sonar systems.

3) Technological advancements and integration with autonomous platforms

Continuous innovation in sonar technology is significantly enhancing system performance, usability, and application scope. Improvements in resolution, real-time data processing, and integration with positioning systems (GNSS, inertial navigation) have increased survey accuracy and efficiency. At the same time, the growing adoption of autonomous and remotely operated platforms—such as unmanned surface vehicles (USVs) and autonomous underwater vehicles (AUVs)—is expanding the deployment of multibeam sonar systems into previously inaccessible or high-risk environments. These advancements reduce operational costs and enable more frequent, high-quality data collection, making multibeam sonar a core technology in modern marine surveying and underwater intelligence applications.
