The global Multifunctional Mobile CT Scanner market size is expected to reach \$ 279 million by 2029, rising at a market growth of 3.0% CAGR during the forecast period (2023-2029).

A multifunctional mobile CT scanner is a type of computed tomography (CT) scanner that can be easily moved from one location to another. Unlike fixed CT scanners, which are permanently installed in a specific location, mobile CT scanners can be transported to different areas of a hospital or healthcare facility to perform scans on patients who are unable to be moved to a fixed scanner. Mobile CT scanners are often used in emergency situations where immediate imaging is required, such as for patients in critical condition who cannot be safely transported to a fixed CT scanner. They may also be used in remote or underserved areas where access to medical facilities is limited. In addition to their mobility, multifunctional mobile CT scanners are designed to perform a variety of imaging functions, including head, neck, chest, abdomen, pelvis, and extremity scans. They may also be equipped with specialized features, such as low radiation dose imaging capabilities, to ensure patient safety.
