Abstracts

The global Multifunctional Phacoemulsifier market size is expected to reach \$ 2173 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

A multifunctional phacoemulsifier is a core ophthalmic surgical device used in cataract surgery to emulsify and aspirate the crystalline lens. It utilizes high-frequency ultrasonic vibration to fragment the opaque lens nucleus into fine particles while simultaneously performing irrigation and aspiration to maintain anterior chamber stability prior to intraocular lens implantation. Multifunctional systems integrate advanced features such as anterior and posterior segment vitrectomy interfaces, dynamic pressure control, energy modulation, and digital parameter management to enhance performance in complex cases.

The system typically consists of an ultrasonic energy generator, a handpiece and phaco tip assembly, an irrigation-aspiration fluidics circuit, a vacuum pump system (peristaltic or Venturi-based), a foot pedal control unit, and real-time pressure monitoring modules. Key technologies include torsional ultrasound delivery, micro-incision energy modulation algorithms, closed-loop anterior chamber stability control, and precise fluidics management.

Upstream suppliers include piezoelectric ceramic components, precision ultrasonic driver modules, microfluidic control components, medical-grade tubing systems, and surgical software developers. Downstream customers include tertiary hospital ophthalmology centers, specialized eye hospitals, and advanced cataract and refractive surgery institutions. The overall industry gross margin generally ranges from 45% to 65%, reflecting strong technological barriers and brand concentration in the premium

ophthalmic equipment segment.

In 2025, the global production of multifunctional phacoemulsifiers was 43,000 units, with an average price of US\$33,800 per unit.
