Abstracts

In order to reduce the reflection loss on the surface of the component, a transparent dielectric film is often coated on the surface of the optical component. This film is called an anti-reflection coating. The function of anti-reflection coating is to reduce the intensity of reflected light, thereby increasing the intensity of transmitted light, making the optical system image clearer. Multilayer AR coatings use several thin film coatings to successively reduce reflected light. Using multi-layer coatings, reflections can be reduced to less than 0.1% of incident light. Multilayer coatings can be designed for specific substrate materials, angles of incidence, and wavelengths to optimize optical performance. Multilayer coatings are more expensive to manufacture, difficult to apply and must be carefully designed. They are generally reserved for high-performance optical instruments.

According to our (Global Info Research) latest study, the global Multilayer Anti Reflection Coating market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
