According to our (Global Info Research) latest study, the global Multilayer Immersion Gold PCB market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Multilayer Immersion Gold PCB represents an advanced and sophisticated electronic circuit board design that marries the strengths of multi-layered board construction with immersion gold surface treatment technology. A multilayer PCB boasts multiple conductive layers interconnected through intricate drilling and plated-through hole techniques, vastly enhancing the board's complexity and signal transmission capabilities. The immersion gold process, also known as electroless gold plating, deposits a uniform, thin, and dense layer of gold onto the surface, enhancing the board's corrosion resistance, oxidation resistance, and significantly improving its soldering performance and signal integrity. This makes it an ideal choice for electronic devices requiring high-frequency, high-speed signal transmission or high reliability standards.
