Abstracts

The global Multilayer Perceptrons market size is expected to reach \$ 15175 million by 2032, rising at a market growth of 12.6% CAGR during the forecast period (2026-2032).

A Multilayer Perceptron (MLP) is a class of feedforward artificial neural network composed of an input layer, one or more hidden layers, and an output layer, where each layer consists of fully connected neurons that apply a weighted sum of inputs followed by a nonlinear activation function. MLPs learn complex, non-linear relationships by adjusting weights through backpropagation and gradient-based optimization, enabling them to approximate arbitrary continuous functions under suitable conditions. Unlike linear models, the presence of hidden layers and nonlinear activations allows MLPs to capture interactions among features, making them widely used for classification, regression, pattern recognition, and representation learning in domains such as finance, healthcare, manufacturing, and control systems.
