Abstracts

The global Multiparticulate Drug Delivery System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Multiparticulate systems also face some challenges, such as production equipment limitations, long production steps, many influencing factors, and potential healing and stability issues. Take pellet tableting as an example. Due to the difficulty of the pellet tableting process, although the product can improve bioavailability, reduce drug dosage, and alleviate adverse reactions, it is easy to delaminate during the tableting process, and the coating film becomes compressed after being coated. It is easy to break, and the pellets collide and fuse with each other when pressed into tablets, and cannot quickly disintegrate into a single pellet in the gastrointestinal tract after taking it.
