Abstracts

The global Multiplex Immunofluorescence (mIF) Technology market size is expected to reach \$ 2389 million by 2032, rising at a market growth of 4.6% CAGR during the forecast period (2026-2032).

Multiplex Immunofluorescence (mIF) Technology is an advanced in-situ detection technology that enables simultaneous specific labeling, visualization and quantitative analysis of multiple target antigens in a single tissue section (FFPE or fresh) via fluorescent-labeled specific antibodies, integrating fluorophore spectral matching, signal amplification (e.g., TSA technology) and high-resolution imaging systems. It overcomes the limitation of traditional single immunofluorescence in target quantity, preserves the original tissue microenvironment, realizes spatial localization and co-expression analysis of multiple biomarkers, and provides high-dimensional data support for biological mechanism research and clinical detection by leveraging key fluorophore properties such as brightness, photostability and Stokes shift.
