According to our (Global Info Research) latest study, the global Multiplexer Integrated Circuit market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

A multiplexer IC is an IC that outputs multiple signals as a single signal. It is also called a MUX, multiplexer or multiplexing device. In digital circuits, it is represented by a rectangular or trapezoidal block notation with a large ratio of length to width, with inputs on the long side and outputs on the short side. Several multiplexer ICs can be combined to increase the number of inputs.

In the field of communications, multiplexers are often used to transmit data from multiple signals by combining them into a single composite wave using switches and filters. On the receiving side, a demultiplexer corresponding to the multiplexer is required to break up the signal of the composite wave into multiple signals so that the signals can be read.
