Abstracts

The global Multistage Chemical Canned Motor Pump market size is expected to reach \$ 340 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

A Multistage Chemical Canned Motor Pump is a hermetically sealed, shaft-seal-free centrifugal pump in which two or more impellers are arranged in series on the common rotor shaft of an integrated canned motor. A thin corrosion-resistant can separates the stator winding from the pumped liquid, while a controlled portion of the process liquid or an auxiliary circulation fluid cools the motor and lubricates the sleeve bearings. The multistage hydraulic section progressively increases discharge pressure, while the enclosed construction prevents routine shaft-seal leakage, making the pump suitable for high-head transfer of toxic, flammable, volatile, corrosive or valuable process fluids in chemical and related industries. In 2025, global Multistage Chemical Canned Motor Pump production reached approximately 5.4 K units.

The increasing emphasis on leak prevention, process safety and control of hazardous emissions is the principal driver of the Multistage Chemical Canned Motor Pump market. Chemical, petrochemical, pharmaceutical and electronic-material plants frequently handle toxic, flammable, volatile or environmentally sensitive liquids under elevated system pressure. Conventional mechanical seals represent a potential leakage and maintenance point, whereas canned motor pumps integrate the pump and motor into a hermetically enclosed unit. Replacement of ageing sealed pumps and the wider adoption of API 685 and ISO 15783 sealless pumping practices are consequently supporting demand for multistage units in high-head critical services.

The expansion of high-pressure continuous-process plants is further increasing demand

for multistage configurations. Refining and petrochemical projects, liquefied-gas transfer, hydrogen and ammonia production, semiconductor chemicals, nuclear power and high-temperature heat-transfer systems require greater discharge pressure than standard single-stage pumps can provide. Manufacturers are therefore extending maximum head, pressure and temperature ranges while incorporating back-to-back impeller arrangements, automatic axial-thrust balancing, secondary containment and online bearing-condition monitoring. These improvements enable multistage canned motor pumps to replace mechanically sealed equipment in a growing range of severe and safety-critical services.
