The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A multi-wavelength ellipsometer is an instrument used to measure the optical rotation of a substance, which can simultaneously measure the optical rotation at different wavelengths. The instrument measures the optical rotation by passing polarized light through two polarizers at the front and back of the sample, and then through a detector. The wavelength range of multi-wavelength ellipsometers usually ranges from ultraviolet to visible light, and even into the near infrared region. It is widely used in medicine, chemistry, food and other fields to analyze and identify the optical properties of substances.
