Muscle Oxygen Monitors are based on a technology which is called as Near-Infrared Spectroscopy. It is a kind of spectroscopy method which uses infrared region of the spectrum. Mainly used in sports.

Muscle oxygen monitors uses light from about 680 nm to about 800 nm. Near infrared light is used in the process of muscle oxygen monitoring because it can travel a very long distance through skin, muscle and fats. It does not get completely absorbed through skin and hence, travels through a long distance. The light is scattered through the tissues rather than travelling in a straight line and helps in making quantifiable measurements.
