Abstracts

According to our (Global Info Research) latest study, the global MVR Equipment market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

MVR (Mechanical Steam Recompression) is a new type of efficient and energy-saving evaporation system, consisting of preheaters, evaporators, separators, and compressors (core components). The working principle of the MVR system is that the secondary steam coming out of the evaporator is compressed by the compressor and sent to the heating chamber of the evaporator as heating steam for circulation, maintaining the boiling state of the material liquid. So as to fully utilize the steam that was originally to be discarded, reduce the use of external heating and cooling resources, and lower energy consumption. MVR evaporation technology has become a trend in industrial development and is expected to become the next generation of evaporation processes. At present, the technologies that have been industrialized in the field of evaporation include single effect evaporation, multi effect evaporation, thermal steam recompression TVR, and mechanical steam recompression MVR. Among them, MVR evaporation technology can fully utilize secondary steam and has the most obvious energy-saving advantages.
