A MW-scale fuel cell power station refers to a fuel cell power generation facility with a power output in the megawatt (MW) range. It is a power station centered on fuel cell technology, which converts chemical energy (typically from the reaction between hydrogen and oxygen) into electrical energy. It primarily consists of a fuel cell stack, fuel supply system, air supply system, cooling system, power management system, and other auxiliary systems. Among these, the fuel cell stack is the core component, where multiple fuel cell units are connected in series or parallel to generate direct current through electrochemical reactions. This direct current is then converted into alternating current by the power management system for output.
