Mycotoxins are secondary metabolites of moulds that contaminate crops and plants. Mycotoxin is capable of infecting both humans and animals. They are poisonous chemical compounds produced by a fungus that infects grains. Mycotoxins can cause disruptions in vital hormonal systems, organ damage, immune system weakness, and even cancer. Controlling mycotoxin contamination requires disseminating information about mycotoxins, anticipating and avoiding contamination, detecting mycotoxins in grains, making effective use of contaminated grain, and breeding fungal resistance into crops.

According to our Fee Research Center, in 2022, global total production of feed was about 1.2 billion tons. Key producing regions are Asia, Europe and North America, top ten countries hold about 65% of global feed production. China, United States, Brazil and India, as the top four countries, accounted for half of the total feed production.
