Abstracts

Mycotoxins are secondary metabolites of moulds that contaminate crops and plants. Mycotoxin is capable of infecting both humans and animals. They are poisonous chemical compounds produced by a fungus that infects grains. Mycotoxins can cause disruptions in vital hormonal systems, organ damage, immune system weakness, and even cancer. Controlling mycotoxin contamination requires disseminating information about mycotoxins, anticipating and avoiding contamination, detecting mycotoxins in grains, making effective use of contaminated grain, and breeding fungal resistance into crops.
