Abstracts

Myocardial infarction, commonly known as heart attack, occurs due to reduced blood flow to a part of the heart, causing damage to the heart muscle. The medications, which are used to treat heart attacks are known as myocardial infarction drugs. The reduced blood flow further causes blockage in the supply of oxygen to the heart, which is due to atherosclerosis, a process in which the plaque is formed on the inside wall of the coronary vein or one of its minor branches. Myocardial infraction occurs to individuals with risk factors such as diabetes, dyslipidemia, and smoking.

Scope of the Report:

This report focuses on the Myocardial Infarction Drugs in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. The risk of developing cardiovascular diseases increases with age as the damages at the tissue, cellular, and molecular level increases in the body. In older people, plaque accumulation in the arteries increases because of the loss of elasticity of the blood vessels, ultimately leading to myocardial infarction. Therefore, increasing the number of patients is driving the market for myocardial infarction globally.

Factors like the growing awareness of cardiovascular diseases will aid the prospects for market growth until the end of the forecast period. Enhanced patient awareness results in an early diagnosis of the disease followed by treatment. Various Heart day campaigns are organized to spread awareness.

The worldwide market for Myocardial Infarction Drugs is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
