According to our (Global Info Research) latest study, the global Myopia Correction Defocus Len market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Myopia correction defocus lenses are lenses that use special optical design to control the progression of myopia. The principle is to use the central part of the lens to correct vision, while creating moderate defocus in the peripheral area to guide light to focus in front of the retina, thereby slowing down the excessive elongation of the eyeball and the deepening of myopia. This type of lens is often used for myopia management in children and adolescents, and is currently one of the important means of non-surgical intervention for myopia control.

Myopia correction defocus lenses are an effective tool for myopia control, especially for children and adolescents, because they can delay excessive eye growth, thereby slowing down the progression of myopia. With the increase in myopia rates around the world, especially in Asia, the use of defocus lenses has gradually become one of the preferred means of non-surgical myopia prevention and control. Although defocus lenses cannot completely cure myopia, they have shown significant effects in early intervention and long-term myopia management through innovative optical design, and have been widely recognized by ophthalmologists. However, the sustainability of the effect and its adaptability to different individuals still require further research and observation.
