Abstracts

The global N-Cyanoamine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The molecular formula of cyanamide is NH_2CN . Soluble in water, ethanol, ether, benzene, chloroform, acetone, etc., slightly soluble in carbon disulfide, poisonous. It transforms into dicyandiamide at 122°C , which is the isomer of carbodiimide ($\text{H}_2\text{NCNHN}=\text{C}=\text{NH}$). Easy to polymerize, three same cyanamide molecules can be combined to form a trimer compound melamine. It is an important intermediate product in the production of dicyandiamide. Because it has highly active cyano and amino groups, it has advantages that dicyandiamide and polycyanamide do not have in the preparation of resin processing, pesticides, pharmaceuticals, and chemical intermediates. advantage.
