Abstracts

The global N-Formyl Peptide Receptor 2 market size is expected to reach \$ 187 million by 2032, rising at a market growth of 16.1% CAGR during the forecast period (2026-2032).

N-formyl peptide receptor 2 (FPR2) is a G-protein coupled receptor (GPCR) located on the surface of many cell types of various animal species. The human receptor protein is encoded by the FPR2 gene and is activated to regulate cell function by binding any one of a wide variety of ligands including not only certain N-Formylmethionine-containing oligopeptides such as N-Formylmethionine-leucyl-phenylalanine (FMLP) but also the polyunsaturated fatty acid metabolite of arachidonic acid, lipoxin A4 (LXA4). Because of its interaction with lipoxin A4, FPR2 is also commonly named the ALX/FPR2 or just ALX receptor. FPR2 is mainly distributed in human immune cells, regulates a variety of important physiological functions, is widely involved in the occurrence and development of various inflammatory diseases, and is closely related to serious diseases such as Alzheimer's disease, AIDS and Crohn's disease. Unlike most GPCRs, FPR2 recognizes a variety of ligands with very different structures, including formyl peptides, non-formyl peptides, lipids, small molecules and proteins, and produces different functions such as anti-inflammatory and anti-inflammatory functions, which makes FPR2 one of the most complex GPCRs with the most complex mechanism of ligand recognition and functional transitions discovered so far. Due to the unknown mechanism of action of FPR2 and its ligand molecules, the development of drugs targeting this receptor has been slow, and no drug has been successfully marketed yet. Since FPR2 drugs are still in the development stage, in this report, we study FPR2 agonists and antagonists chemicals.
