Abstracts

A nacelle-mounted light detection and ranging (LIDAR) system is a remote-sensing device that is used in the wind industry for measuring the wind curve measurements. It is considered as a potential alternative for the met mast, a tool used for reducing the uncertainties in the annual energy production (AEP), which reduces the operational and maintenance costs and helps in the optimization of the turbine performance.

Scope of the Report:

This report focuses on the Nacelle Mounted LIDAR Systems in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Modern wind turbines comprise of active yaw and pitch control systems to change the angle according to the wind flow to improve. These systems rely on the nacelle based anemometers for acquiring real-time data that enables automatic control operations. However, some of the factors that cannot be controlled by the operator include the wind resource and the flow complexity. Such factors impact the power generation and cause yaw misalignment, which affects power performance. Also, yaw misalignment results in an uneven flow of the wind that spins the rotor in one direction and immediately slows down. Under such circumstances, the nacelle LIDAR helps to identify the misalignment and transmits the data to the sensor to correct the alignment that improves the annual energy production (AEP) and return on investment (ROI).

The worldwide market for Nacelle Mounted LIDAR Systems is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
