Abstracts

A nacelle-mounted light detection and ranging (LIDAR) system is a remote-sensing device that is used in the wind industry for measuring the wind curve measurements. It is considered as a potential alternative for the met mast, a tool used for reducing the uncertainties in the annual energy production (AEP), which reduces the operational and maintenance costs and helps in the optimization of the turbine performance.

Scope of the Report:

This report focuses on the Nacelle-Mounted Systems for Wind in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Generating electricity from wind is highly dependent on meteorological conditions unlike the conventional power generation from fossil fuels. Factors such as technological advances and developments in the blade designs are responsible for the increasing wind turbine output and capacity. It has been observed that by doubling the rotor size or diameter, the power output increases fourfold. The need to increase renewable powergeneration is leading to the increasing adoption of wind towers and turbines which in turn will trigger the growth of the nacelle-mounted LIDAR systems market for wind industry.

The worldwide market for Nacelle-Mounted Systems for Wind is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
