Nano Calcium Carbonate for Polyurethane is a functional inorganic filler developed for polyurethane systems. Its main component is nano-scale or colloidal calcium carbonate, usually treated with fatty acids, coupling agents or composite surface modification to improve its dispersion, compatibility and storage stability in polyurethane resins, prepolymers and additive systems. The product can improve thixotropy, reinforcement, anti-sagging performance and overall cost structure while maintaining processability. Key indicators include particle size, specific surface area, oil absorption, moisture content, degree of surface treatment and dispersion stability.

The upstream of Nano Calcium Carbonate for Polyurethane mainly includes limestone, lime, carbon dioxide, surface modifiers, dispersants and packaging materials. The midstream involves carbonation reaction, crystal morphology control, surface modification, drying, deagglomeration and classification to produce specialized powders. Downstream applications mainly include polyurethane sealants, polyurethane adhesives, polyurethane coatings, polyurethane elastomers and other polyurethane materials. Its value is mainly reflected in improving rheology control, filling and reinforcement, processing stability and cost optimization in polyurethane systems.
