Abstracts

The global Nano Silver Sinter Paste for SiC Power Modules market size is expected to reach \$ 566 million by 2032, rising at a market growth of 10.0% CAGR during the forecast period (2026-2032).

In 2025, the global sales volume of nano-silver sintering paste for SiC power modules reached 12,000 kg, with an average price of approximately \$23,000 per kilogram.

Nano-silver sintering paste for SiC power modules is a highly reliable interconnect material composed of nano/micro-nano composite silver particles, organic vehicles, and dispersion systems. It enables the formation of a silver sintered layer characterized by high thermal and electrical conductivity and high-temperature operational stability at relatively low temperatures. It is primarily used to replace high-lead solders and certain conductive adhesives. Key performance indicators include sintering pressure, sintering temperature, thermal conductivity, shear strength, void ratio, printability, and automotive-grade reliability. Upstream components mainly include high-purity silver powder, nano-silver particles, dispersants, solvents, and resin systems; downstream applications primarily target SiC main drive modules for new energy vehicles, inverters for photovoltaics and energy storage, rail transportation, and industrial power modules.
