Abstracts

Nanomaterials, along with advancements in nanotechnology, have the potential to revolutionize existing industries and create entirely new applications. In the last decade, nanotechnology has advanced at a rapid pace, and it holds enormous prospects for biomedical applications. Nanofibers are important and versatile class of one-dimensional nanomaterials that are attracting increasing attention from academics as well as several industries in recent years. Nanofibers can be prepared from a wide range of materials such as polymers, ceramics, and metals.

Scope of the Report:

This report focuses on the Nanofiber Materials for Biomedical Industry in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Nanofibers are proving to be an important material for applications in biomedical industry including medical filters and membranes, medical textiles, wound dressings, drug delivery, tissue engineering, and biosensors.

The need for implants with enhanced functional life and biodegradability as one of the primary growth factors for this market. The traditional implant materials have short functional life, with failures arising from implant loosening, inflammation, infection, and wear debris. This resulted in the need for the development of new cytocompatible bone substitutes with substantially enhanced functional life to regenerate bone tissues.

Titanium and its alloys are widely used in orthopedic and dental implant materials due to their compatible mechanical properties and biocompatibility.

The worldwide market for Nanofiber Materials for Biomedical Industry is expected to

grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
