## Abstracts

Nanogrids are the modular building blocks for efficient and reliable energy solutions that support applications extending from emergency power for commercial buildings to the delivery of basic electricity services to people living in extreme poverty. Mostly nanogrids are just small microgrids that normally serve a single building or load. In most cases, the technology requirements for nanogrids are less complex than those for either microgrids or the utility-dominated smart grids, mainly because of their simplicity.

### Scope of the Report:

This report focuses on the Nanogrid in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The proliferation of cell phone usage, which is prompting demand for electricity in remote regions of the world, provides a model of technology dispersal that mimics the Internet. It is more in line with nanogrids than traditional utility distribution systems. A common analogy when discussing nanogrids in the developing world is that of cell phones and the skipping of phone landlines—in similar ways these regions are jumping to nanogrids in lieu of traditional centralized transmission infrastructure.

The worldwide market for Nanogrid is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
