Abstracts

Nanowire is a type of nanostructures which possess attractive properties such as high electrical, thermal and mechanical properties. It is the solid material in the form of a wire with diameter less than that of 100 nm. It can be synthesized either by top down approach or by bottom up approach. Nanowire finds applications in electrical, magnetic, optical fields. In nanowires, the ballistic movement of electrons are observed and this leads the nanostructure to be employed in various electronic devices. VLS (Vapor-Liquid-Solid) process is one of the most successful approach for the synthesizing single-crystalline semiconductor nanowires. Manufacturers produce nanowires to custom specifications and in bulk quantities. The unique features of the nanowires make them ideal materials for numerous electrical and optical applications, photovoltaics, sensors, transistors, piezoelectric generators, and energy storage technologies.

SCOPE OF THE REPORT:

This report focuses on the Nanowire in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Nanowires are the key materials used in the transistors. The demand for dimensionally smaller transistors is expected to drive the market for nano wires. The doping process is carried out on the surface of semi conducting nanowires for creating active electronic elements. P-type and N-Type semi-conductors are also manufactured by using the nanowires. The logic gates such as AND, OR, and NOT gates have been built from semiconductor nanowires. Nanowires can be produced with self-assembly techniques, providing complex structures with relatively simple and standard process equipment.

The worldwide market for Nanowire is expected to grow at a CAGR of roughly xx% over

the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
