## Abstracts

A nasal cannula interface is a medical device used to deliver supplemental oxygen to patients who require assistance with breathing. It consists of a lightweight, flexible tube with two small prongs that are inserted into the patient's nostrils. These prongs deliver oxygen directly into the nasal passages, allowing it to be absorbed into the bloodstream. Nasal cannulas are commonly used in various healthcare settings, including hospitals, clinics, and home care settings. They are typically prescribed for patients with respiratory conditions such as chronic obstructive pulmonary disease (COPD), asthma, pneumonia, or respiratory failure. The flow of oxygen through the nasal cannula can be adjusted to meet the patient's specific oxygenation needs. The device is connected to an oxygen source, such as an oxygen tank or concentrator, which provides a continuous flow of oxygen at the prescribed rate.
