A Nasal Feeding Tube is a medical device, usually made of soft plastic or rubber material, used to introduce liquids, nutrients, medications, or gases into a patient's stomach or intestines. It is inserted through one of the patient's nostrils and then down the esophagus into the stomach or intestines. Nasal Feeding Tube can introduce nutrient solution into the patient's stomach or intestinal tract to meet the patient's nutritional needs. It is usually used in situations where sufficient nutrition cannot be taken in through the mouth, such as postoperative recovery, patients with dysphagia or inability to eat. The selection and use of nasogastric tubes should be decided by medical professionals based on the patient's specific conditions and treatment purposes, and medical operating standards should be strictly followed to ensure the patient's safety and comfort.
