A nasopharyngeal airway (NPA) tube is a medical device used to maintain an open airway and facilitate breathing in patients who are at risk of obstruction, particularly those with sleep apnea or other conditions that cause upper airway obstruction. It is a flexible tube made of soft plastic or rubber material that is inserted through one nostril and extends down into the back of the throat, bypassing the tongue and other structures that can obstruct the airway. The NPA tube helps to ensure that air can pass freely through the nose and mouth into the lungs, improving oxygenation and reducing the risk of respiratory distress. It is commonly used in emergency medicine, critical care, and surgery, as well as in sleep medicine and otolaryngology.
