According to our (Global Info Research) latest study, the global Natural Language Processing (NLP) in Healthcare market size was valued at US\$ 1448 million in 2025 and is forecast to a readjusted size of US\$ 3434 million by 2032 with a CAGR of 13.3% during review period.

Natural language processing (NLP) is a branch of artificial intelligence that deals with the interaction between computers and humans using the natural language (spoken or written data), not in the artificial languages such as Java and C++.

The ultimate objective of NLP is to read, decipher, understand, and make sense of the human languages in a manner that is valuable. Most NLP techniques rely on machine learning to derive meaning from human languages.

For healthcare use, NLP is used to improve patient engagement and bring in efficiency in decision-making capabilities, it can also convert complex clinical narratives into actionable data points and insights.

Natural Language Processing (NLP) is first developed in the 1950s, it has blossomed over the past 25 years with the availability of cheap, plentiful, and powerful computers working in parallel fashion.

Healthcare industry is a unique industry that need put more effort on the application of NLP, it is because in practice, off-the-shelf NLP libraries and algorithms built for English will fail miserably on this ?different language? in the health care industry.

For example, SoB in healthcare means short of breath. If you don't know that, it is hard to understand one patient's the report or document then difficult to make decision.

At the same time, there are research show that about 80% of medical data is showed in unstructured format, which need to get structured data conversion, so NLP in healthcare is an a very promising but very challenging industry that requires specialized medical language and text services.
