Abstracts

The global Natural Pigments for Feed market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The natural pigments for feed market refers to the segment of the animal feed industry that involves the production and distribution of pigments derived from natural sources such as plants, algae, and other microorganisms, which are added to animal feed to enhance its nutritional value, improve the appearance of the animal products, and promote the health and growth of livestock.

The market for natural pigments for feed is driven by the growing demand for natural and organic feed products, as consumers are increasingly concerned about the safety and healthfulness of the food they consume. Additionally, the rising awareness about the benefits of natural pigments, such as their antioxidant properties, their ability to boost immunity, and their role in improving animal health, is further driving the demand for these products in the feed industry.

Some of the commonly used natural pigments for feed include carotenoids, phycobiliproteins, anthocyanins, and betalains, which are derived from sources such as marigold flowers, spirulina, red cabbage, and beets, respectively. These pigments are used in the production of feed for a variety of livestock, including poultry, swine, aquaculture, and pet animals.
