Abstracts

The global Natural (White) Hydrogen Exploration market size is expected to reach \$ 2928 million by 2032, rising at a market growth of 29.3% CAGR during the forecast period (2026-2032).

Natural (white) hydrogen exploration refers to the systematic search, identification, evaluation, and resource estimation of hydrogen resources that are continuously generated and accumulated within the underground lithosphere, utilizing geological, geochemical, geophysical, remote sensing, and drilling technologies. Its core objective is to determine the generation mechanism, migration pathways, and reservoir traps of hydrogen. Through methods such as geochemical anomaly detection, seismic and electromagnetic exploration, multiphysics modeling, and exploratory drilling, it aims to pinpoint exploitable underground hydrogen-rich areas, thereby providing fundamental geological evidence and resource assessment support for the future commercial exploitation of natural hydrogen resources.

Natural hydrogen exploration is in the early stages of a breakthrough in the global energy system and is considered one of the emerging energy directions that may reshape the future low-carbon hydrogen supply structure. Its development prospects are mainly driven by the goal of carbon neutrality, the pressure to reduce the cost of hydrogen energy, and the progress of deep earth science. With the discovery of natural hydrogen surface seepage and potential enrichment systems in regions such as Australia, France, the United States, and Africa, and the exploratory drilling verification by companies such as Koloma and Mantle8, this field is moving from the 'geological hypothesis stage' to the 'resource verification and early commercial exploration stage'. If stable and recoverable natural hydrogen resources are developed in the future, it may form an energy alternative path similar to the shale gas revolution, becoming an

important source of low-cost, low-carbon hydrogen, and driving the rapid expansion of geophysical exploration, AI geological modeling, deep drilling, and underground energy system engineering. However, it still faces key constraints such as uncertain resource distribution, complex reservoir structure, and unverified economic recoverability.
