Abstracts

The global Nautical Positioning Radar Detector market size is expected to reach \$ 2046.9 million by 2029, rising at a market growth of 5.1% CAGR during the forecast period (2023-2029).

In recent years, some governments and their defense agencies have been forced to increase border security and surveillance due to the increase in cross-border conflict and terrorist activities around the world. Modern radar systems that are more accurate, reliable, and work better are critical to border security and the surveillance tactics that different governments are using. Realizing that the government is looking for effective and cost-effective defense solutions, producers of military radar systems are paying particular attention to balancing quality and cost while installing retrofit solutions to upgrade existing solutions to the latest standards. Hence, increasing number of cross-border conflicts and terrorist activities drives the growth of the global marine radar market over the forecast period. Technological developments and rising demand for high-tech weapons, devices, and armaments are other key factors driving market expansion for the marine radar industry. The market is expected to witness significant growth over the forecast period on account of increasing demand for cutting-edge artillery systems. The global market is segmented into x-band and s-band. The S-band segment is expected to dominate the market during the forecast period. Radar systems are required for various hydrometeorological and navigational purposes requiring observations during precipitation and rainfall. In severe weather conditions, S-band radars are used to generate accurate and reliable observations. S-band radar operates in the 2GHz to 4GHz microwave region of the electromagnetic spectrum. High spatial and temporal resolution approximations are produced by S-band frequency radars. S-band radar provides a long-range view to help engineers plan in adverse conditions. S-band radar systems are able to provide wide coverage over both land and water due to

their high radiated power. S-band radar is widely used because of its low attenuation and is an off-the-shelf long-range weather detection radar. On the other hand, the x-band radar market is expected to witness substantial growth over the forecast period. Ships or other large vessels often use X-band radar to continuously monitor an area of the sea several kilometers square. The growth of the market is driven by factors such as increasing number of seagoing vessels and offshore installations and increasing usage of vessel traffic control and navigation radars.

Nautical positioning radar detectors are radar detectors installed on ships for navigation avoidance, ship positioning, and narrow channel navigation. Wavelet electromagnetic waves are emitted when the echo is received, which helps to identify the range, angle or velocity of the target. Nautical radar detectors offer advantages for maritime navigation and collision avoidance. It provides mariners with the necessary means of observation when visibility is poor, and even in adverse weather or climatic conditions, they can detect stationary and moving objects, which helps avoid accidents.
