The global Nautical Thermometer market size is expected to reach \$ 105 million by 2032, rising at a market growth of 4.4% CAGR during the forecast period (2026-2032).

Nautical thermometers are instruments designed specifically for measuring the temperature of air or seawater on ships and in the marine environment. They are widely used in navigation safety, meteorological observation, fisheries operations, marine scientific research, and crew living support. In 2025, global Nautical Thermometer production reached approximately 3780 k units, with an average global market price of around 20 US\$/Unit. The production capacity of Nautical Thermometer reaches 4700 k units, and the industry's gross profit margin is approximately between 20% and 40%.

The demand for nautical thermometers remains constant, driven by multiple factors, including the rigid reliance on monitoring basic meteorological parameters for ship navigation safety, the need for accurate seawater temperature data in global fisheries and marine scientific research activities, the aesthetic and functional preferences for traditional marine instruments in recreational sailing culture, and the requirements of maritime regulations for recording key environmental parameters. At the same time, under the design concept of electronic redundancy systems, even when equipped with advanced weather stations, mechanical thermometers are still widely retained as passive backup devices, supporting their stable application in both professional and civilian markets.

This report studies the global Nautical Thermometer production, demand, key manufacturers, and key regions.
