Abstracts

The global Naval Inertial Navigation System market size is expected to reach $ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The future trends of Naval Inertial Navigation Systems (INS) are expected to focus on advancements in technology such as the integration of artificial intelligence and machine learning algorithms to improve accuracy and reliability. Additionally, there will likely be a shift towards the use of MEMS (Micro-Electro-Mechanical Systems) sensors for smaller, more lightweight systems that can be easily integrated into various naval platforms. Furthermore, there will be a greater emphasis on interoperability and connectivity with other navigation systems, such as GPS and satellite navigation, to provide a more comprehensive and robust navigation solution for naval vessels. Overall, the future trends of Naval INS will be driven by the need for more precise and reliable navigation capabilities in increasingly complex maritime environments.

The Naval Inertial Navigation System (INS) is a precision navigation device used by naval vessels to determine their position, velocity, and attitude without relying on external references such as radio signals or celestial bodies. It employs a combination of gyroscopes and accelerometers to measure changes in angular velocity and acceleration, respectively, which are then integrated over time to calculate the vessel's displacement and orientation. The INS is self-contained and operates independently of external factors, making it an essential component of submarine navigation and stealth operations where discretion is paramount. Additionally, it can be used in conjunction with other navigation systems, such as GPS or radar, to enhance accuracy and reliability.
