Abstracts

The global NC Protein Transfer Membrane market size is expected to reach \$ 167 million by 2032, rising at a market growth of 7.5% CAGR during the forecast period (2026-2032).

An NC Protein Transfer Membrane is a porous, high-purity nitrocellulose matrix designed specifically to immobilize proteins separated by gel electrophoresis through a process called electroblotting.

In practical terms, it acts as a 'protein capture substrate.' After proteins are separated by size in a polyacrylamide gel, they are transferred ('blotted') onto this membrane. The membrane binds the proteins tightly via hydrophobic interactions (and possibly electrostatic forces), preserving the spatial separation achieved in the gel. This immobilization allows the proteins to be probed with antibodies for detection and analysis without being washed away.

This report studies the global NC Protein Transfer Membrane production, demand, key manufacturers, and key regions.
