## Abstracts

According to our (Global Info Research) latest study, the global NC Protein Transfer Membrane market size was valued at US\$ 101 million in 2025 and is forecast to a readjusted size of US\$ 167 million by 2032 with a CAGR of 7.5% during review period.

An NC Protein Transfer Membrane is a porous, high-purity nitrocellulose matrix designed specifically to immobilize proteins separated by gel electrophoresis through a process called electroblotting.

In practical terms, it acts as a 'protein capture substrate.' After proteins are separated by size in a polyacrylamide gel, they are transferred ('blotted') onto this membrane. The membrane binds the proteins tightly via hydrophobic interactions (and possibly electrostatic forces), preserving the spatial separation achieved in the gel. This immobilization allows the proteins to be probed with antibodies for detection and analysis without being washed away.

This report is a detailed and comprehensive analysis for global NC Protein Transfer Membrane market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application.
