Abstracts

The common ratio of nickel, cobalt and aluminum in nickel-cobalt-aluminum ternary materials is 8:1.5:0.5, and the content of aluminum is very small, so it can be understood as close to binary materials. Al (transition metal) instead of manganese for modification of lithium nickel, cobalt and manganic acid by ion doping and surface coating. Ion doping can enhance the stability of materials and improve the cycle performance of materials. However, in the production process, Al is an amphoteric metal and is not easy to precipitate, so there is a threshold in the production process of NCA materials.
