Abstracts

NDIR (Non-Dispersive Infrared) Gas Sensor Modules are devices used for the detection of gases in the air. They are based on the principle of infrared absorption spectroscopy.

Here's how they typically work:

Infrared Light Source: NDIR sensors have an infrared light source that emits light in the infrared spectrum. This light passes through or reflects off a sample chamber containing the gas to be detected.

Gas Absorption: The gas molecules in the sample chamber absorb specific wavelengths of infrared light that are characteristic of the molecular structure of the gas.

Detector: The sensor has a detector that measures the intensity of the infrared light after it passes through the sample chamber. The amount of light absorbed by the gas is proportional to the concentration of the gas in the chamber.

Analysis: By analyzing the difference in the intensity of the emitted and detected light, the sensor can determine the concentration of the gas in the sample chamber.

NDIR gas sensor modules are widely used for detecting various gases such as carbon dioxide (CO2), carbon monoxide (CO), methane (CH4), and other hydrocarbons. They are commonly employed in applications such as indoor air quality monitoring, industrial safety, automotive emissions monitoring, and HVAC systems.

According to our (Global Info Research) latest study, the global NDIR Gas Sensor
