According to our (Global Info Research) latest study, the global Near-alpha Titanium Alloy market size was valued at US\$ 609 million in 2025 and is forecast to a readjusted size of US\$ 918 million by 2032 with a CAGR of 6.0% during review period.

In 2025, global Near-alpha Titanium Alloy production reached approximately 16,000 tons, with an average global market price of around 37,000 US\$/ton.

Near β titanium alloy is a type of titanium alloy that takes β solid solution as the matrix, containing a small amount of α phase usually 2% to 8% in a stable state and 8% to 15% after rapid cooling from the β region and is alloyed with β -stabilizing elements such as aluminum, tin, and zirconium, along with a small quantity of α -stabilizing elements like molybdenum and vanadium in an amount of 1% to 2% typically. Distinguished from pure β titanium alloys by the presence of minor α phase, it retains the excellent high-temperature creep resistance, thermal stability, and weldability of β titanium alloys while improving hot workability, with a long-term service temperature of up to 300°C and even capable of maintaining structural integrity at temperatures as high as 593°C for some grades, and it can be produced by vacuum consumable arc melting, mainly used to manufacture plate welded structural parts and other components. Its microstructure is dominated by β phase with minor α particles distributed along grain boundaries, and it cannot be strengthened by heat treatment but can be stress-relieved and annealed, offering moderate mechanical strength, good fracture toughness, and corrosion resistance.

The demand for near β titanium alloy is mainly driven by key industries such as aerospace, energy, and medical care, with about 65% of global consumption

concentrated in the aerospace field, where it is widely used in jet engine high-pressure compressor stages, airframes, and hypersonic system components due to its lightweight, high-temperature resistance, and strength-to-weight ratio, supported by the rebound of commercial aviation and the development of hypersonic defense and space programs; in the energy sector, it is applied in offshore oil and gas subsea pipelines, wellheads, and tidal turbine blades for its corrosion resistance and durability, benefiting from the expansion of offshore oil and gas projects and renewable energy investments; in the medical field, its biocompatibility and fatigue strength make it suitable for spinal implants and surgical tools, driven by the aging population and the development of additive manufacturing technology. Corresponding business opportunities lie in multiple aspects: regions like North America, Europe, and China with strong aerospace and industrial demand present huge market potential, especially China, Germany, and Japan which are key consumption markets; the development of additive manufacturing can reduce production lead times by about 40%, creating opportunities for customized component production and process optimization.
