According to our (Global Info Research) latest study, the global Near-Field RFID Antennas market size was valued at US\$ 372 million in 2024 and is forecast to a readjusted size of USD 655 million by 2031 with a CAGR of 9.0% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Near-field RFID antenna is a type of antenna designed for reading or writing RFID tags at very short distances, usually operating in low-frequency (LF, 125–134 kHz) or high-frequency (HF, 13.56 MHz) bands. This type of antenna uses the principle of inductive coupling for communication and is suitable for application scenarios with a read and write range of less than a few centimeters, such as access control, smart cards, electronic tickets, library management, and medical asset tracking. Unlike far-field UHF antennas, near-field antennas do not rely on radio wave radiation but on magnetic field interaction, so they have the advantages of strong resistance to metal interference, precise reading area, and high security. Although its reading distance is short, it plays an irreplaceable role in scenarios with high requirements for privacy, accuracy, and environmental adaptability.
