According to our (Global Info Research) latest study, the global Near-Infrared II (NIR-II) Fluorescence Imager market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

A near-infrared II fluorescence imaging system is a device used for fluorescence imaging in the near-infrared II wavelength range (approximately 1000 to 1700 nanometers). It works by exciting samples with near-infrared light of specific wavelengths, causing the samples to emit fluorescence signals, which are then captured by an imaging system. This type of imaging system is commonly used in biomedical research, drug development, and materials science because it provides high-contrast images and has strong penetration capabilities for biological tissues.
