According to our (Global Info Research) latest study, the global Negative Carbon Portland Cement market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Negative CO₂ cement represents a greener alternative to regular cement. Cement manufacturers and companies utilizes carbon negative cement in buildings due to less energy consumption to enhance the utility of raw materials such as limestone, clay, and marl. Negative CO₂ cement has the ability to store atmospheric carbon in the fabric of the building. CO₂ negative cement consumed more carbon dioxide than emitting. Furthermore, instead of limestone (CaCO₃) industries are using magnesium silicates (MgO₃Si) as alternative which come from olivine, talc, and serpentine. MgO₃Si have no carbon emission on heating. A lower temperature means that the amount of fossil fuels used to run the process is being decreased. Negative CO₂ cement reduces carbon emissions of poured concrete from 800kg emitted per ton to 50kg absorbed per ton. According to think tank Chatham House, cement is the source of about 8% of the world's CO₂ emissions.
