Abstracts

The global Negative Carbon Portland Cement market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Negative CO₂ cement represents a greener alternative to regular cement. Cement manufacturers and companies utilize carbon negative cement in buildings due to less energy consumption to enhance the utility of raw materials such as limestone, clay, and marl. Negative CO₂ cement has the ability to store atmospheric carbon in the fabric of the building. CO₂ negative cement consumed more carbon dioxide than emitting. Furthermore, instead of limestone (CaCO₃) industries are using magnesium silicates (MgO₃Si) as alternative which come from olivine, talc, and serpentine. MgO₃Si have no carbon emission on heating. A lower temperature means that the amount of fossil fuels used to run the process is being decreased. Negative CO₂ cement reduces carbon emissions of poured concrete from 800kg emitted per ton to 50kg absorbed per ton. According to think tank Chatham House, cement is the source of about 8% of the world's CO₂ emissions.
