## Abstracts

The global Negative Electrode Carbon Coating Material market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The negative electrode carbon coating material is mainly pitch, and the polyaromatic ring structure compound formed by cross-linking and solidification of pitch is similar to graphite material, with strong binding force, which improves the compatibility between the negative electrode material and the electrolyte, and prevents the co-embedding of solvents. Decomposition and exfoliation of graphite structure, with high reversible electrochemical capacity, improves the first-time Coulombic efficiency and cycle stability of anode materials. Asphalt is further divided into coal-based asphalt and petroleum-based asphalt. After graphitization, the petroleum-based asphalt has a higher gram capacity and lower pollution emissions. Therefore, the current negative electrode carbon coating is based on petroleum-based asphalt.

This report studies the global Negative Electrode Carbon Coating Material production, demand, key manufacturers, and key regions.
