The global Negative Electrode Welding Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Negative electrode welding machine usually refers to a device used in battery manufacturing to weld the negative electrode connection of the battery. In batteries, the negative electrode refers to the negative electrode plate of the battery or the negative current collector of the battery, which receives electron flow during the charging and discharging process. A battery usually consists of a positive electrode, a negative electrode, and an electrolyte. The positive and negative poles of a battery are responsible for the electrochemical reactions of the battery. Welding is an important step in connecting the negative electrode of a battery to other battery components, ensuring the performance and stability of the battery. The main function of the negative electrode welding machine is to connect the negative electrode to the current collector or negative electrode plate of the battery. Usually, specific welding methods such as spot welding or wire welding are used to firmly connect the negative electrode to the current collector or plate to ensure good current conduction and battery stability. These welding machines typically have highly precise control systems to ensure the quality and consistency of welding. The negative electrode welding machine plays a crucial role in the battery manufacturing process, and the quality directly affects the performance and lifespan of the battery. With the rapid development of electric vehicles and renewable energy, the demand for high-quality batteries is also increasing. Therefore, negative electrode welding technology is also constantly improving and innovating.
